

The Benefits of Laser Surgery

Updated June 2010

- Use of a surgical laser **decreases the amount of blood lost** during surgery. Since the laser coagulates blood as it cuts you pet will bleed less from the skin incision and any other incisions. This is especially important for areas with a lot of blood supply.
- Laser surgery is **less painful**. Surgical lasers seal nerve endings as they cut so that there is decreased sensation to the surgical site. This help you pet be more comfortable when recovering from surgery.
- There is **less swelling** of the incision site after laser surgery than after traditional surgery which means that your pet will be more comfortable throughout recovery.
- For many types of surgery your pet will need to spend **less time in the hospital** for laser surgery than they would for traditional surgery. Because of the benefits of using the laser, recovery is quicker and less stressful for your pet.
